                                                                                                                          This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legiess (1gs) protein, a downstream component of the Wnt/Wingless (Wnt/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Wnt pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblascoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the human legless (1gs) protein homologue 1gs/bc19 described in the
                                                       vel polypeptide useful in therapeutic method for treating disorders cell fate such as cell differentiation or cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                0

Sequences ABA00225-ABA00254 represent 1350 novel numb polypeptides, and sequences ABA00225-ABA00254 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and methods of identifying compounds which bind to polypeptides, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation activities, including cytokine, cell proliferation activities, including cytokine, cell proliferation or cell differantiation activities; stem cell growth factor activities, including cytokine, cell proliferation or characteric activities, hemospacial cytivity; cities of thrombocic or chemokinetic activities, planemascratic, thrombocic or chemokinetic activities, planemascratic, chrombocic or chemokinetic activities, planemascratic, thrombocic or chromokinetic activities, planemascratic, chrombocic or chemokinetic activities, planemascratic or may be conditions, e.g., by protein or gene therapy Such conditions include canners, haematopoletic disorders (e.g., myeloid or lymphoid cell canners, haematopoletic disorders (e.g., myeloid or lymphoid cell canners, haematopoletic disorders (e.g., myeloid or lymphoid cell canners, haematopoletic disorders (e.g., myeloid or proverting) conditions, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnord activities may be used in the treatment of viral, mannemoduladory activities may be used in the treatment of viral, bactor activity activity may be used in cell culture to give rise to neurosepithelial cells or number or renjace coll growth factor activity was been cell growth. Por example, such polypeptides may be used to promote cell growth for or replace cell gr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human
                                                                                                                                                                                                                                                                                                                                                               Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                     Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer.

New beta-catenin nuclear localised protein for diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence of human beta-catenin nuclear localised protein #2.
                              The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence of mouse beta-catenin nuclear localised protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                       New beta-catenin nuclear localised protein for diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence mouse beta-catenin nuclear localised protein #2.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Legless; fruitfly, lgs; Wnt/Wingless signaling pathway, Wnt; Wg; tissue proliferation; tumour; cytostatic; cellular disorder; colon; blood disorder; cancer; breast; head and neck cancer; brain; thyroid; medulloblastoma; skin cancer; tissue regeneration; tissue repair.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            homologous amino acid domains with the legiess (1989) protein, a downstream component of the Mut/Wingless (Wnt/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Mut pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the human legiess (19s) protein homologue higs-1 described in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fungicide, cytostatic, essential gene, Aspergillus fumigatus, infection, cancer, contamination, biofilm, antibody; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (1gs) protein, a downstream component of the Wnt/Wingless (Wnt/Ws) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over stimulation of the Wnt pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the Drosophila melanogaster (fruitfly) legless (1gs) protein described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                   vel polypeptide useful in therapeutic method for treating disorders cell fate such as cell differentiation or cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                  The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat a non-infectious by a pathogenic organism such as A. fumigatus, to prevent infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object organism such as A. fumigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fumigatus. The polynuclectides are useful for expressing recombinant protein for characterisation, screening or expanisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify optential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for ralaing anti-protein antibodies, as an anti-DNA antibodies or to elicit another immune antigen to raise anti-DNA antibodies or to elicit another immune cresponse, and for identifying polynucleotides encoding the other protein contains antibodies or to elicit immune response, as a reagent in assays designed to quantitatively therefore in the protein introduction as a marker for the protein in the protein introduction as a marker for the protein interval or the protein interval
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention.
                                                                                                                                                                                          New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                              solated nucleic acid detection reagent for detecting 1000 or more from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated mucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL46175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; primer; detection; diagnosis; antisense therapy; gene therapy.

The present invention describes primer sets for synthesising 5602

(ull-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
to the complementary strand of a polynucleotide which comprises one of
cligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprises a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
of an oligonucleotide comprises a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a sequence complementary to the
polynucleotide which comprises a 1'-end sequence, where the
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide of polynucleotide which comprises at least 15 nucleotides and the combination of
complementary full-length comprises as selected from those defined in
the specification. The primers are useful for synthesising polynucleotides,
complementary full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the promenality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
complementary and specialised methods. AAH3364 to
AAH3633 represent human amino acid sequences; AAB32446 to
AAB3893 represent human amino acid sequences; and AAH33622
complementary full-desired from the exemplification
complementary and produces and the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression ievel of a marker in a control inon-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the patients of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian cancer (e.g. patients having a familial history of ovarian cancer (e.g. batlents having a familial history of ovarian cancer (e.g. batlents nevous system disorders (e.g. batanent occancer). The cancer markers may be used in the management and treatment of viral meningitis, Alzheimer's disease or Parkinson's disease, brain and central nervous system disorders (e.g. batchill). Alzheimer's disease or Parkinson's disease, brain herniations), testicular disorders (e.g. nonteuberculous granulomatous orchitis), testicular disorders (e.g. nonteuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. inchemining whether ovarian cancer vertanes and methods may also be used in assessing the histological type of neoplasm associated with or metastasize, selecting a composition for inhibiting ovarian cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer are risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer. The progression of overlan cancer or at risk of developing ovarian cancer. The progression of the ovarian cancer or at risk of developing overlan cancer or at risk of developing overlan cancer.
                                                                                                                                                                                                                                                                                                                                                 Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and from a non cancer patient -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GTPase activating protein; GTPAP1; cell signalling; immune disorder; cell proliferative disorder; cancer; colon cancer; arteriosclerosis; diabetes; psoriasis; hepatitis; multiple sclerosis; gene therapy.

The present sequence represents a human GTPase activating protein, designated GTPAPI. GTPAP polynucleotides and polypeptides are useful for treating or preventing a disease or condition associated with altered expression of GTPase activating proteins, especially cell signalling, immune and cell proliferative disorders, including cancer especially colon cancer. Examples of diseases treatable include
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 14; Fig 1A-E; 78pp; English

```

The present sequence represents a human GTPase activating protein, designated GTPAP2. GTPAP polymucleotides and polypeptides are useful for treating or preventing a disease or condition associated with altered expression of GTPase activating proteins, especially cell signalling, immune and cell proliferative disorders, including cancer especially colon cancer. Examples of diseases treatable include arterioscie. diabetes, psoriasis, hepatitis and multiple sclerosis. GTPAPI polymucleotides are also useful for gene therapy treatments of the diseases.

Sequence 15, Application US/09650855
Patent No. 6365355
APRICANT: MCUTHER-MALONEY, SANDRA
APPLICANT: LAWRENCE LIVERMORE NATIONAL LABORATORY
TITLE OF INVENTION: CHIMPRIC PROTEINS FOR DETECTION AND QUANTITATION OF DNA
TITLE OF INVENTION: MUTANITON: MISWATCHES
TITLE OF INVENTION: MISWATCHES
                                                                                                                                                                                                                                                                                                                      Sequence 15, Application US/09651656
Patent No. 6340566

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 186

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TIGE SEEDING RECULATORY PHOTORECEPTOR WHICH EXISTS IN TWO FORMS THAT ABSORBS MAXIMALLY IN THE RED REGION. PHOTOCONVERSION OF PR IN THAT ABSORBS. MARXIMALLY IN THE FARE RESION. PHOTOCONVERSION OF PR IN THAT ABSORBS. PRR COMPROJENT THE EXPRESSION OF A NUMBER OF NUCLEAR CREDS INCLUDING THOSE BROOKONY THE SWALL. SUBUNIT OF RIBULOSE-BISPHOSPHATE CARBOXLASE, RAMA, ETC. IT ALSO CONTROLS

THE EXPRESSION OF ITS OWN GENE(S) IN A NEGATIVE FEEDBACK FASHION.
 SIMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF TRANSCRIPTION FACTORS. ASC SUBFAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MutS protein.";
Nucleic Acids Res. 26:4153-4159(1998).
-!- FUNCTION: This protein is involved in the repair of mismatches in DNA. It is possible that it carries out the mismatch recognition step. This protein has a maximal ATPase activity at 80 degrees Celsius. Binds double-stranded DNA.
-!- SUBUNIT: Homotetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

RID Res. 8:205-313(2001)

C. - FUNCTION: THE SIGAM FACTOR IS AN INITIATION FACTOR THAT PROWOTES
ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND

THEN IS RELEASED.

C. - SIMILARITY: Belongs to the sigma-70 factor family.
